

Understanding the AI — a plain-language guide

For users and for the owner · 20 July 2026 · fleet-wise-delta.vercel.app

Fleet Wise has an AI assistant — a "copilot" — that knows about **your** vehicles and answers questions about them in plain English. This guide explains what it is, how to use it, what it can and cannot do, and how it protects your information. No technical knowledge needed.

1. What is the copilot, in one minute?

Imagine a very knowledgeable assistant who has read every service record you have entered — every oil change, brake job, tyre and repair — and remembers all of it perfectly. You can ask that assistant anything about your vehicles, the way you would text a friend, and it answers instantly.

That is the copilot. It does not replace your mechanic. It helps you **notice things in time**: a service coming due, a vehicle that is quietly costing too much, a repair that keeps coming back. The goal is simple — **fewer surprise breakdowns and lower costs**.

The most important thing to understand: the AI only knows what **you** put into Fleet Wise. It reads your vehicle list and service records to answer. It does not know things you have not recorded, and it cannot see other people's vehicles. If you have entered nothing, it has nothing to talk about — so the more you record, the more useful it becomes.

2. How to use it — step by step

- 1 Add your vehicles (see section 6 — you can even do it by taking a photo).
- 2 Log the services you remember: what was done, how much it cost, and roughly when.
- 3 Open **AI Copilot** and either tap one of the suggested questions or type your own.
- 4 Read the answer. Ask a follow-up in your own words if you want more.

Good questions to ask

- "Which of my vehicles needs servicing soon?"
- "How much have I spent on my Toyota this year?"

- "Which vehicle is costing me the most, and why?"
- "When is the next oil change due for [your plate]?"
- "Are any of my vehicles becoming unreliable?"
- "Summarise everything I spent last month."

The suggested buttons under the chat are built from your **own** vehicles, so they always mention plates you actually own — never examples.

3. What it can and cannot do

The copilot CAN	The copilot CANNOT
• Tell you what services are due or overdue • Add up and compare your costs • Spot vehicles with unusual repair patterns • Explain a vehicle's full history • Predict roughly when the next routine service is due	• Know anything you have not recorded • See or reveal another user's vehicles • Diagnose a fault from a noise or symptom like a mechanic • Book repairs or spend money for you • Guarantee exact dates — its predictions are estimates

It is honest by design. The AI is instructed never to invent information. If you ask about a vehicle you have not entered, or for a figure it does not have, it will say so plainly rather than make something up. That is deliberate — a confident wrong answer about your vehicle would be worse than "I don't have that."

4. Where does the intelligence come from? (For the owner)

This is the question every founder should be able to answer, so here it is clearly.

Fleet Wise does **not** train its own AI model. It uses a ready-made large language model from OpenAI — the same family of technology behind ChatGPT — through a secure connection. Training a model from scratch would cost enormous money and time and is completely unnecessary here.

Instead, the app uses a technique called **grounding**. Every time a user asks a question, Fleet Wise quietly gathers that user's vehicle and service data, and sends it to the model *together with* the question and a strict instruction: *"Answer only from this data. Never invent anything."* The model reads the data fresh each time and replies.

Two things follow from this:

- **It is always up to date.** Because the data is gathered fresh on every question, a service you logged one minute ago is already known — no retraining, no waiting.

- **It stays honest and private.** The model only ever sees the data for the person asking. It is not "learning" from your fleet in the background, and one customer's data is never mixed with another's.

5. The token system — why there are daily limits

Every question sent to the AI costs a small amount of real money, paid to the model provider. The cost is measured in **tokens** — think of tokens as the "fuel" a question burns. A short question about one vehicle burns a little fuel; a big question about a large fleet burns more, because more information has to be read.

To keep the service sustainable, each plan comes with a **daily fuel tank** of tokens that refills every day:

Plan	Price	Daily tokens	Roughly
Free	\$0	5,000	a few questions a day
Premium	\$20 / month	50,000	dozens of questions a day
Business	\$100 / month	100,000	all-day heavy use

Under the chat you will see a small line like *"4,180 of 5,000 daily AI tokens left · refills in 5h 12m."* When the tank runs dry, the copilot pauses and tells you when it refills — **midnight UTC**, every day. You are never charged for a question the AI could not answer.

For the owner — why tokens instead of "questions": a "question" is not a fair unit, because a question about 200 vehicles genuinely costs far more than one about two. Counting questions would let the biggest users cost you the most while paying the least. Counting tokens ties each user's limit to the real cost they create — which is why your margins stay safe: even a Business user maxing their tank every single day costs under a dollar a month in AI fees against \$100 of revenue.

6. Adding a vehicle by photo

Not everyone knows what a "VIN" is or where to find it. So instead of filling the form by hand, a user can tap **"Scan a photo instead"** and simply take a picture of:

- the car itself,
- its number plate,
- the registration or insurance document, or
- the odometer (the mileage display).

The AI reads the photo and fills in whatever it can see — plate, make, model, VIN, mileage. **You then check the details and press Add.** The AI only fills the form for you; nothing is saved until you confirm it.

And, as everywhere in Fleet Wise, it will leave a field blank rather than guess at something it cannot clearly read.

7. Your privacy

- **Your data is yours.** Your vehicles and records belong to your account and are protected so that no other user can reach them.
- **The AI does not train on your data.** Your information is used only to answer your own questions, in the moment, and is not used to teach the model.
- **You are in control.** You can edit or delete any vehicle or record at any time, and switch maintenance-reminder emails on or off whenever you like.

8. Honest limitations — please read

So you trust it appropriately, here is what to keep in mind:

- **It is only as good as your records.** Missing or wrong entries lead to missing or wrong answers. Keep your services up to date.
- **Predictions are estimates.** "Due in about 3 weeks" is based on typical service intervals, not your exact driving. Treat it as a helpful nudge, not a legal deadline.
- **It is not a mechanic.** It works from your records, not from inspecting the vehicle. For a diagnosis of a strange noise or warning light, see a professional.
- **Numbers can occasionally slip.** For an important financial decision, glance at the underlying records too — they are always there on the vehicle's page.

9. Quick answers

Do I need internet? Yes, for AI answers. If the connection or the AI is briefly unavailable, the app still answers simple questions from your data using built-in rules, and tells you when it has done so.

Will it share my data with other users? No. Each person only ever sees and asks about their own vehicles.

What happens when I run out of tokens? The copilot pauses until midnight UTC, when your daily allowance refills — or you can upgrade for a bigger daily tank.

Is the AI always right? No AI is. It is built to be honest and to refuse to guess, but you should still sanity-check anything important against your records.

Does it cost me money to ask a question? Not directly — your plan includes a daily allowance. You only pay the monthly subscription for a bigger allowance.

Fleet Wise — Understanding the AI. Written for everyday users and for the owner, 20 July 2026. This guide can be updated as the product grows.
